Summary

- 6+ years software development experience in distributed systems, wireless networking, sensor networking, and embedded systems
- 2 years web development experience

Education

2008–2014	**Wayne State University**, *Ph. D. in Computer Science*, GPA 3.93/4.0.
2004–2008	**Wuhan University, China**, *B. S. in Computer Science*, GPA 3.60/4.0.

Patent

H. Zhang, X. Liu, C. Li, "PRK-Based Scheduling for Predictable Link Reliability", U.S. Provisional Application #61/788,445, International Application #PCT/US2014/27055

Technical Skills

Languages: expert in C, TinyOS/nesC, and Matlab; proficient in C++ and LaTeX; prior experience in Python, Java, C#, Objective-C, ASP, PHP, Javascript, and HTML

Databases: MS SQL Server and MySQL

Operating systems: Linux, Mac OS X, and Windows

Wireless Standards: 802.11 and 802.15.4

Experience

4/12 – 4/14   **Research Assistant**, *Wayne State University*, Michigan.

The patent-pending Physical-Ratio-K based Scheduling Protocol (PRKS) is the first-ever practical distributed scheduling algorithm to ensure reliability of wireless communication while maximizing throughput.

- Designed the architecture of PRKS: split code into reusable encapsulated components, grouped components wth coupled functionalities, and organized groups in a tree hierarchy.
- Implemented, single-handedly, PRKS, its two variants, and four state-of-the-art protocols from scratch, on sensors with merely *10kB* RAM using TinyOS. The source code ($\sim$**58,000** lines) is available at `https://github.com/xhliu/prks`.
- Debugged, *without gdb*, these complex distributed protocols in two multi-hop dynamic testbeds of 127+ sensors and fixed non-repeatable and timing-dependent bugs caused by race conditions and inconsistent distributed states.
- Increased link reliability from as low as 0% in the state of the art to 95% in PRKS.

9/09 – 3/12   **Research Assistant**, *Wayne State University*, Michigan.

Multi-Timescale Adaptation (MTA) Routing Protocol is the best distributed routing algorithm for delivering probabilistic real-time traffic.

- Implemented, independently, MTA, its seven variants, and four other protocols from the ground up in TinyOS. Code ($\sim$**16,000** lines) is at `https://github.com/xhliu/mta`.
- Modified TinyOS kernals systematically to make code run concurrently and enable real-time computing, including radio communication stack, time synchronization, and resource arbitration.
- Increased deadline success ratio by 89% and reduced transmission cost by a factor of 9.7, shown in two testbeds of 127+ nodes.

2/09 – 5/09   **Technical Team Member**, *LifeCode Health*, Michigan.

LifeCode is a remote health monitoring system to compete in Microsoft Imagine Cup.

- Built a Windows mobile phone application in C# to receive and display real-time heartbeat rates collected by wearable sensors and transmitted to the phone via Bluetooth.

11/08 – 5/09	**System Administrator**, *Wayne State University*, Michigan.

11/08 – 5/09 **System Administrator**, *Wayne State University*, Michigan.
Students in lab course CSC1000 report machine breakdowns by filing tickets in a web-based system.
- Designed database schema and implemented the ticketing system using the Linux, Apache, MySQL, and PHP (LAMP) stack, enabling users to insert, update, delete, search, and dump tickets online.

12/07 – 3/08 **Software Engineer Intern**, *Wicresoft Company*, China.
Microsoft Forefront Security (MFS) is a business antivirus software product that can be controlled over the network.
- Wrote test cases and tested MFS on different Windows families, architectures, and languages.
- Automated tests using MS-DOS scripting to run MFS on remote machines with various above configurations.

9/06 – 11/07 **Chief Development Officer**, *Trinity Studio*, China.
Trinity Studio is a studio I co-founded with three classmates, building websites for small businesses, government agencies, and universities.
- Designed database schema using SQL Server and Access.
- Developed back end using ASP, IIS, and ODBC.

Open Source Community Participation

TinyOS is the de facto operating system for low-power wireless devices, such as those used in sensor networks and personal area networks. `http://www.tinyos.net`. I have reported several bugs, including:
- Patch accepted: fixing bug to set default tx power in cc2420x. `https://github.com/sallai/tinyos-main/commit/974ff870551d6fcc86f44e311dcbfd0fb71dbc94`
- Patch accepted: fixing bug in duplicate detection in CTP. `https://www.millennium.berkeley.edu/pipermail/tinyos-help/2010-March/045095.html`

Awards

2009 Microsoft Imagine Cup US Software Design Top 15 Finalist
2012 Outstanding Graduate Research Assistant (GRA) Award, Wayne State University
2005 National Scholarship, China
